

KEPT

Promises *compound.*

Invest a little every week, with people who notice.

THE PROBLEM

“I’ll start investing next *week*.”

Nothing happens when you skip

Every habit worth building has someone who notices you didn’t. Investing has no one.

Apps score the wrong thing

A balance you didn’t move, at the top of the screen. What you control — putting money in — appears nowhere.

Social means exposure

Leaderboards and shared portfolios ask you to show friends your net worth. People sensibly decline.

THE INSIGHT

Habits stick when someone *notices*.

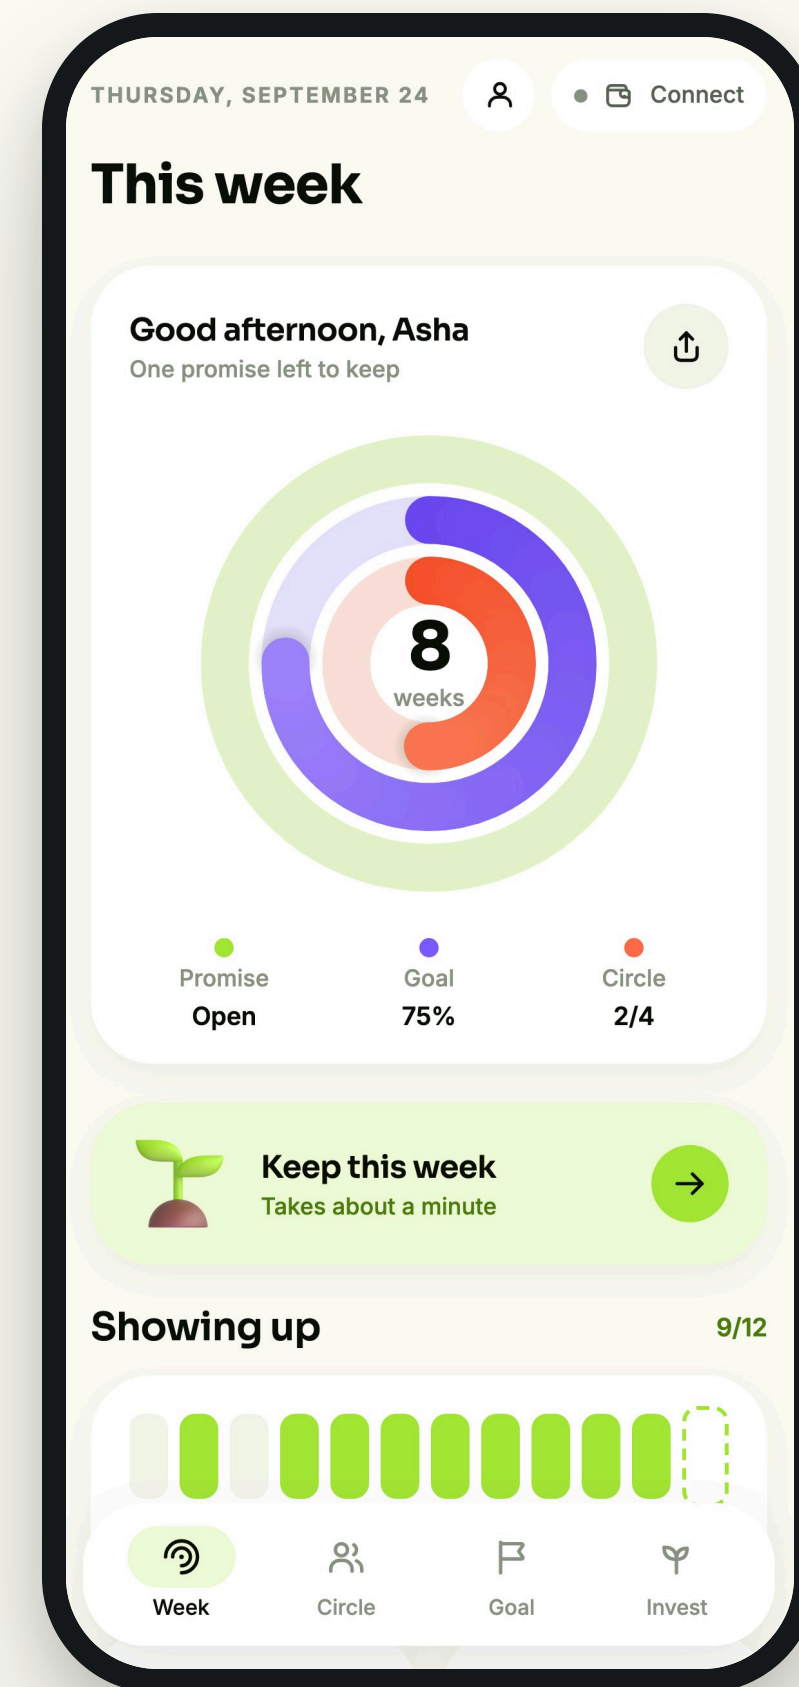

Activity rings made exercise visible and shareable. KEPT does the same for investing — and shares the progress, never the money.

THE PRODUCT

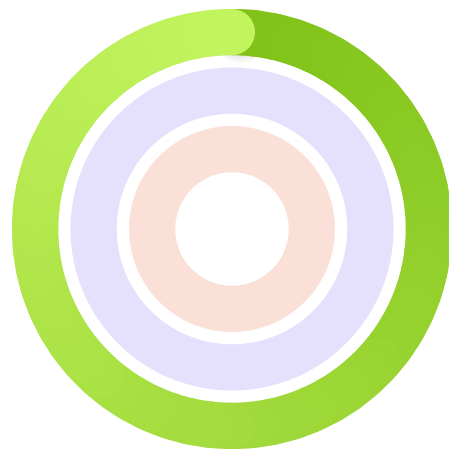

One small promise, *kept* every week.

- 1 **Promise** an amount and a day — *\$25, every Friday.*
- 2 **Keep it** by buying a real asset from your own wallet.
- 3 **Your circle sees** that you kept it. Never how much.

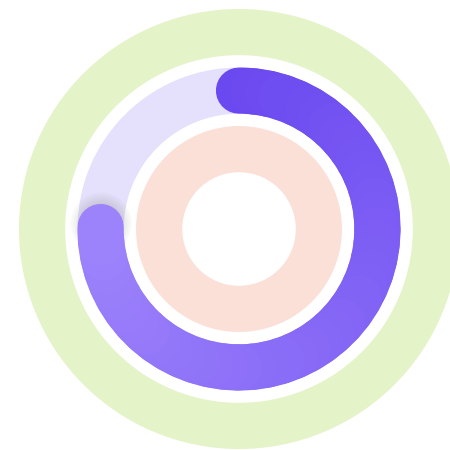

THE RINGS

Three questions, one glance.

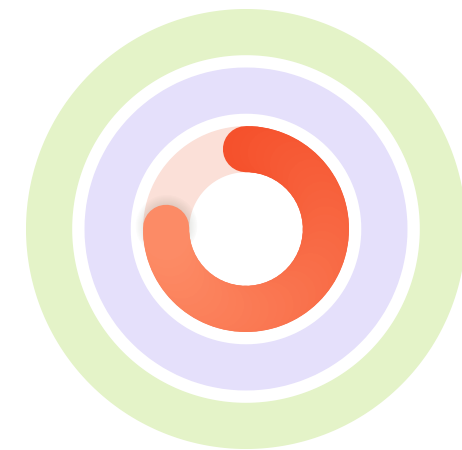

Promise

Did you keep this week? Fills when you do — and empties every Monday, so there is always one small thing to finish.

Goal

How far along your goal you are — twelve weeks of showing up, a year, whatever you chose.

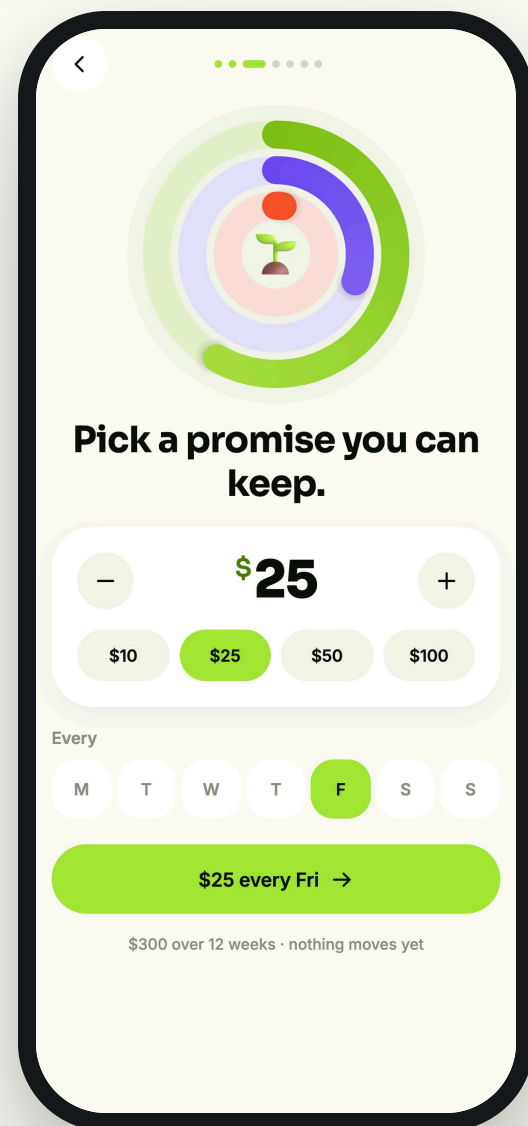

Circle

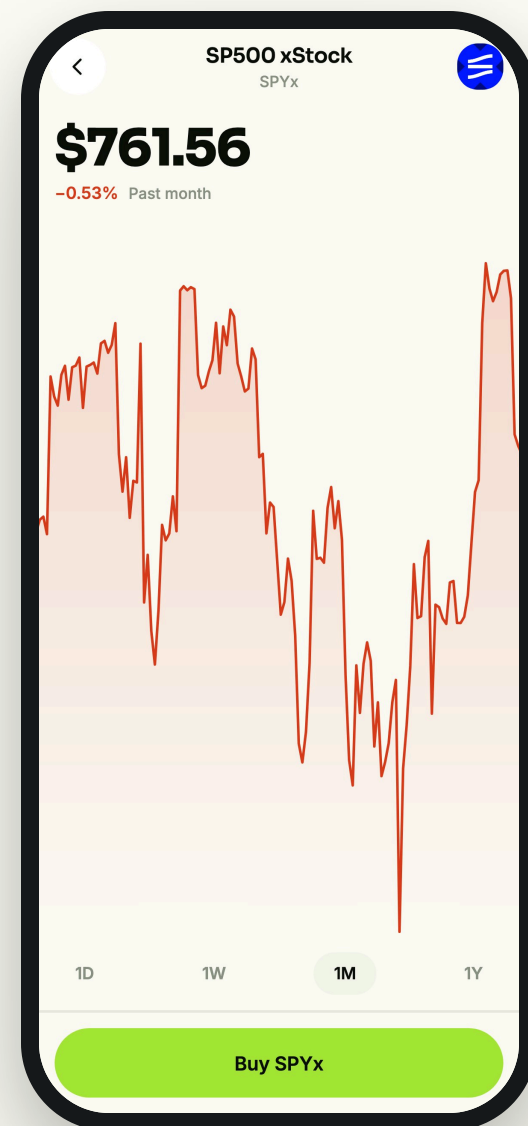

How many of your people kept theirs. Nothing makes you open your wallet like watching a friend do it first.

HOW IT WORKS

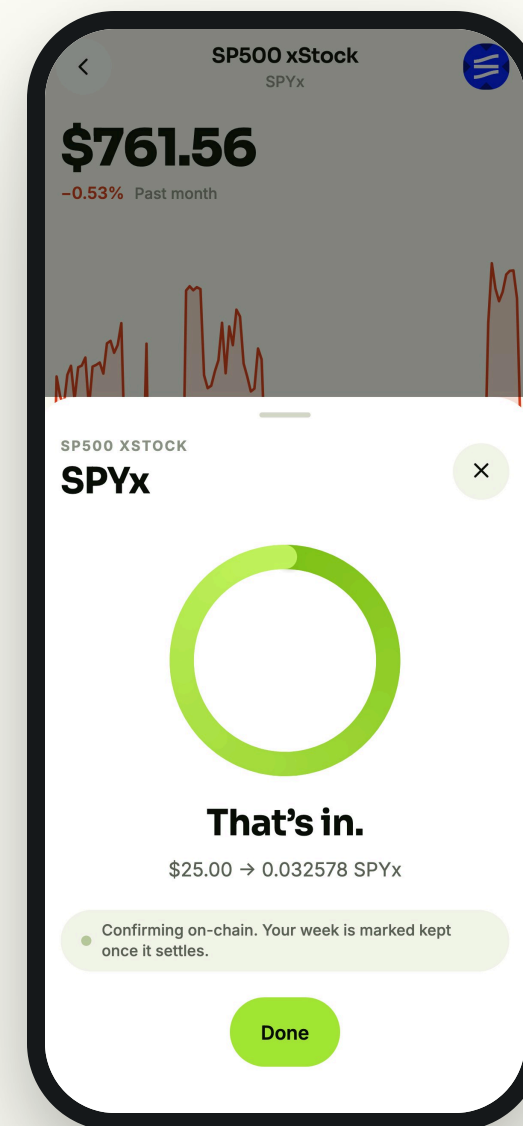

From promise to noticed, in about a minute.

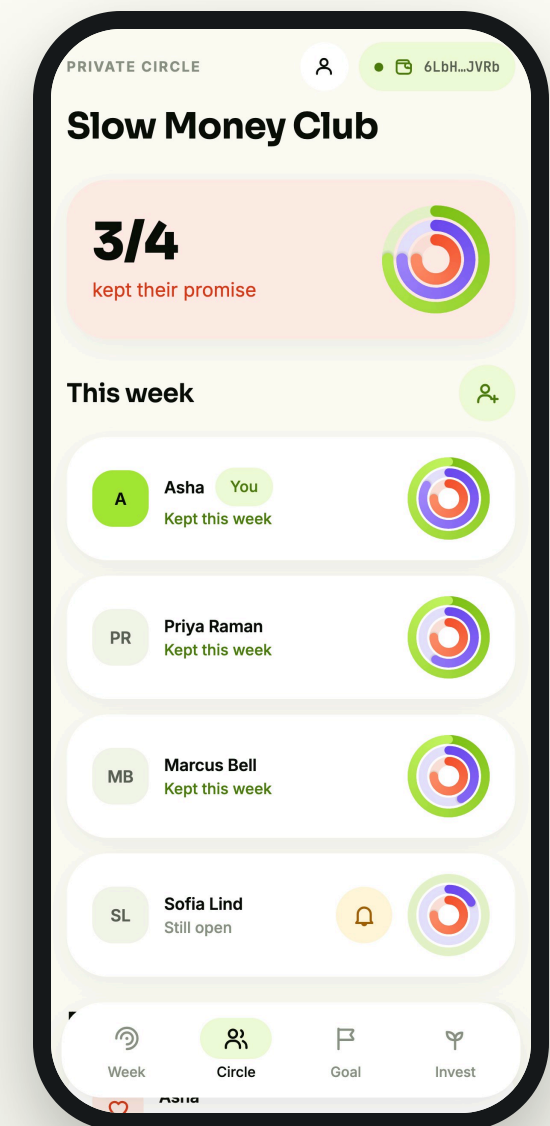

1 • Promise. An amount and a day.

2 • Invest. Pick a real asset.

3 • Kept. Approve in your wallet.

4 • Noticed. Your circle sees it, live.

PRIVACY

They see the ring. *Never the number.*

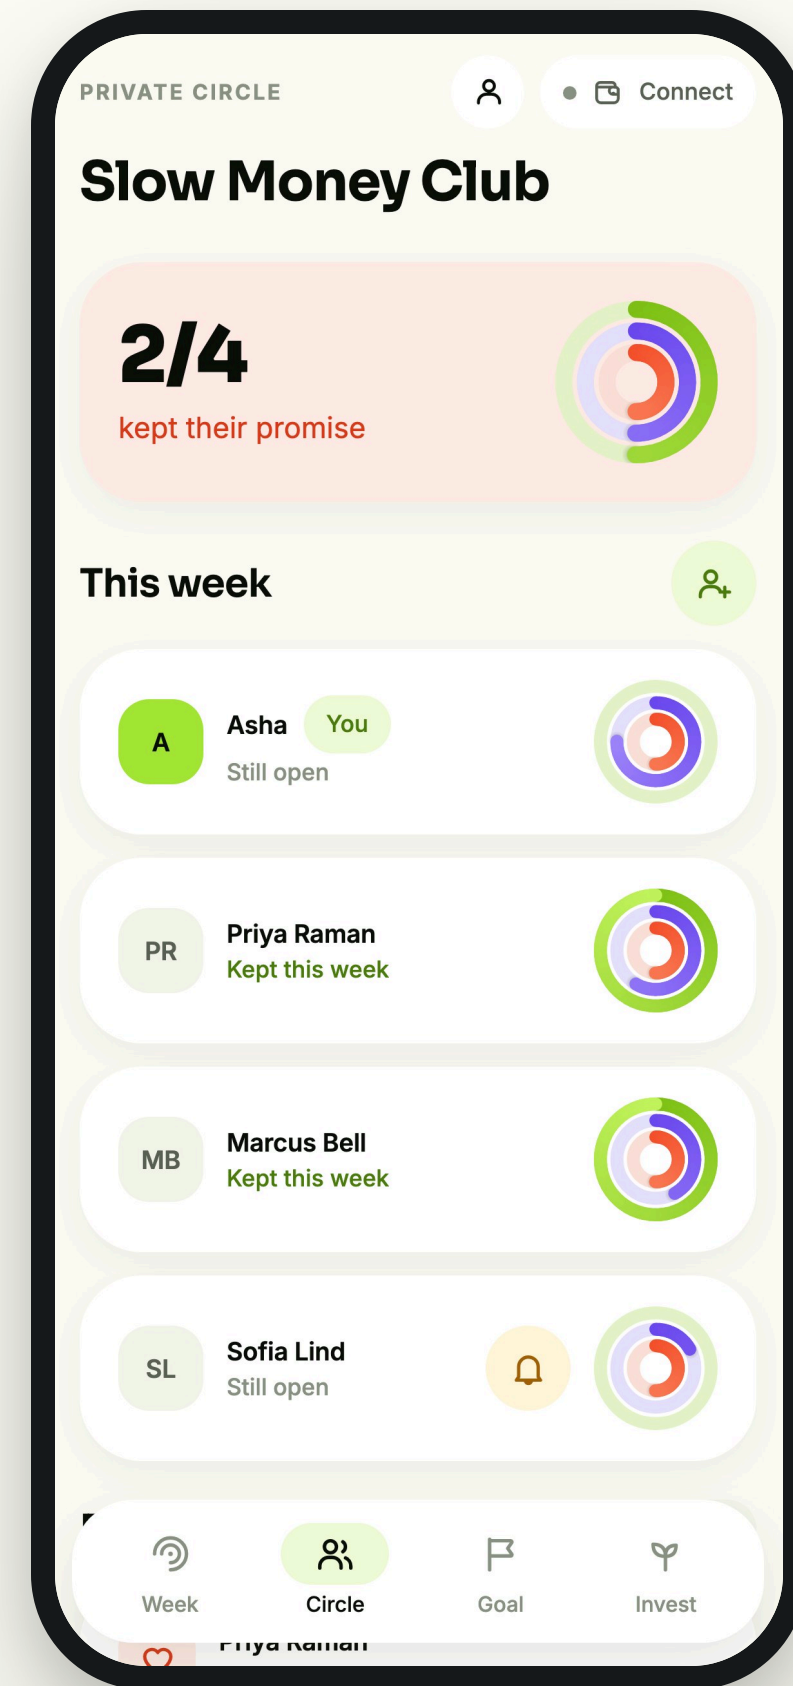

Your circle sees

Your name · that you kept this week · your streak · your awards · your goal ring, as a shape

Nobody sees

How much you promised · what you bought · what it's worth · your balance or holdings

Not hidden by default — a friend's app has no way to ask for those numbers. So a student putting in \$10 and a friend putting in \$500 have identical rings, and keep each other going as equals.

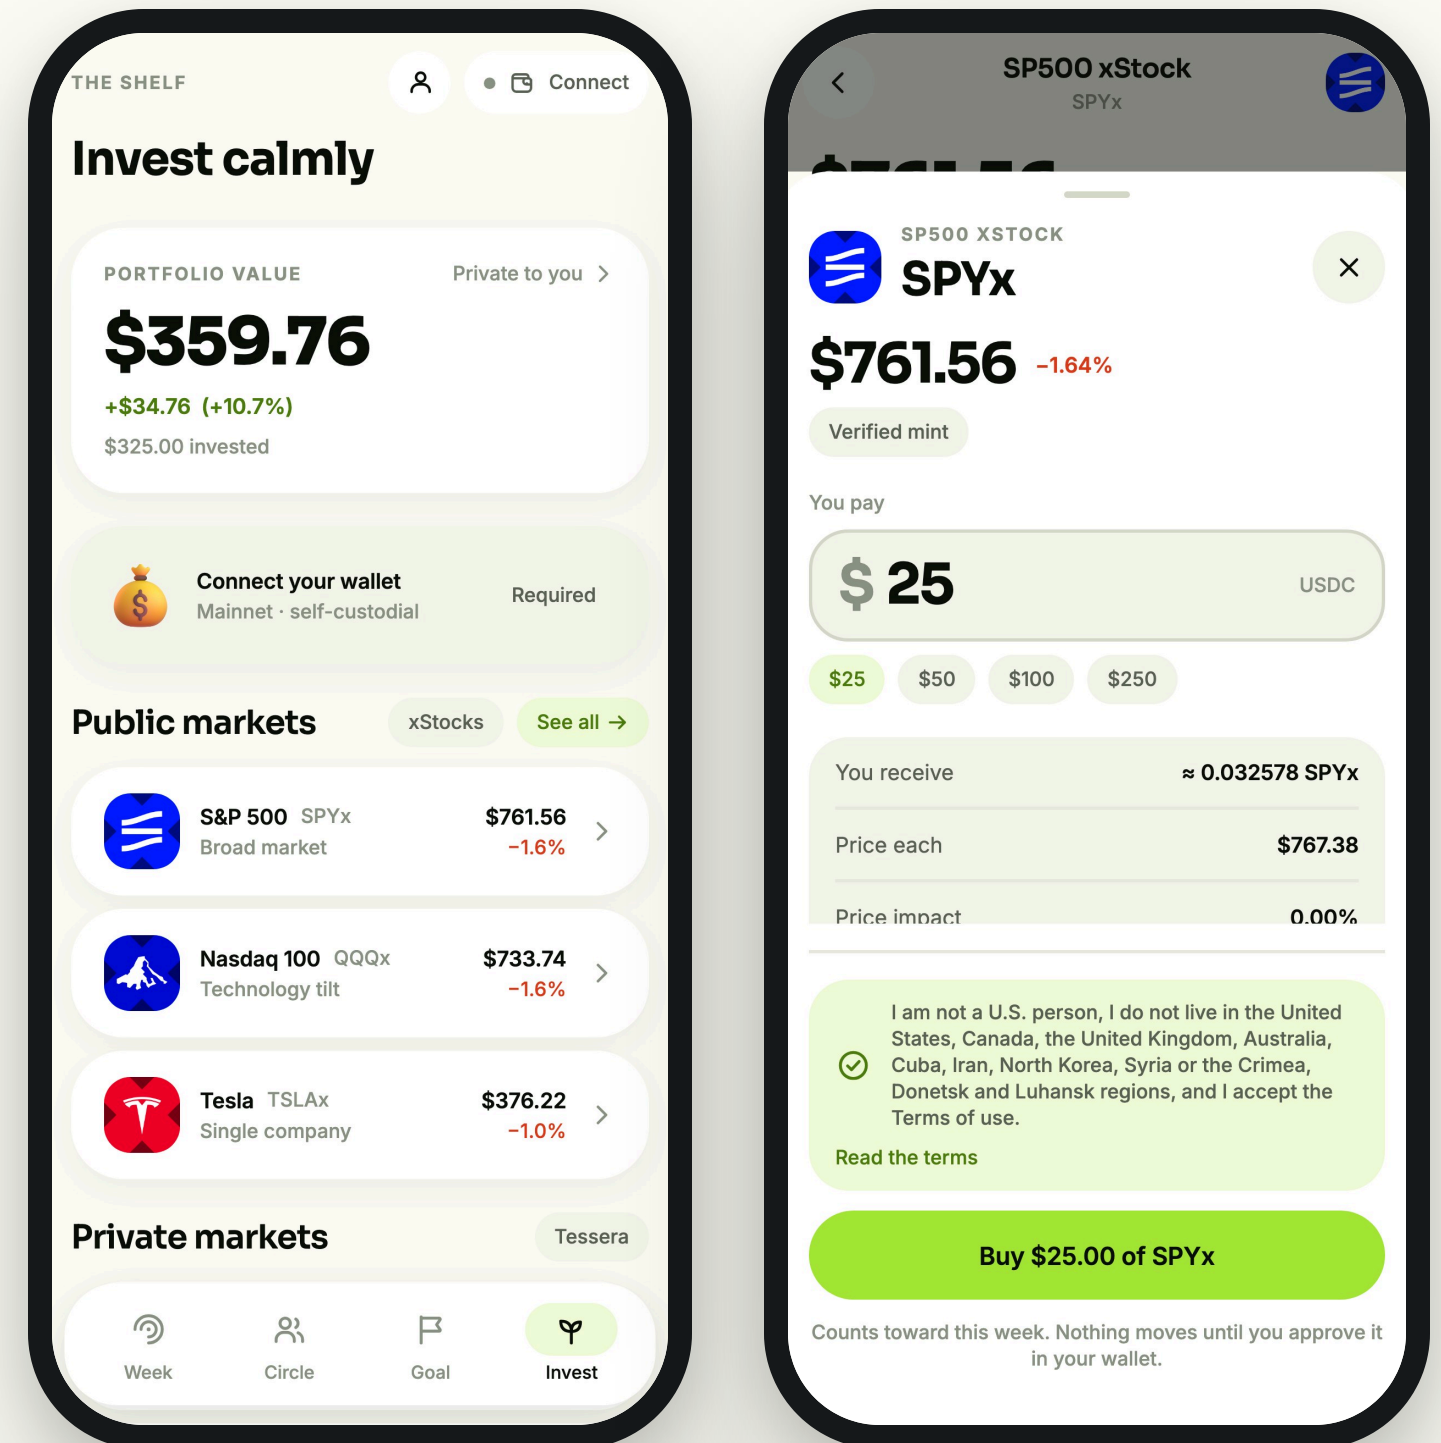

REAL ASSETS

A real position, in *your* wallet.

- **1,100+ tokenized stocks and ETFs** through xStocks — the S&P 500, Nvidia, Tesla, gold — priced live.
- **Private markets** through Tessera — OpenAI, SpaceX, Kalshi — marked *Private*, behind a disclosure you accept first.
- **Fractional**, so \$20 buys a real slice. Routed by Jupiter, approved in your own wallet.
- **Yours to leave with.** KEPT never holds funds or keys; sell back to USDC any time.

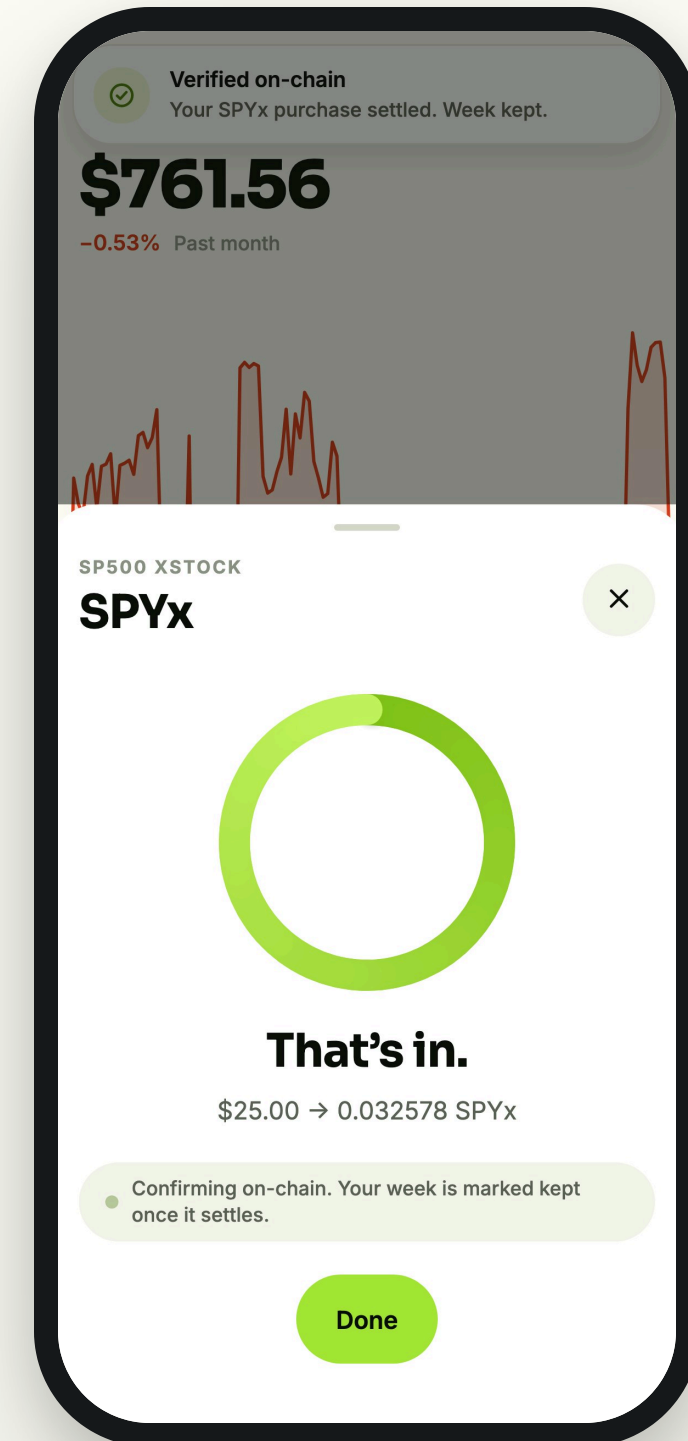

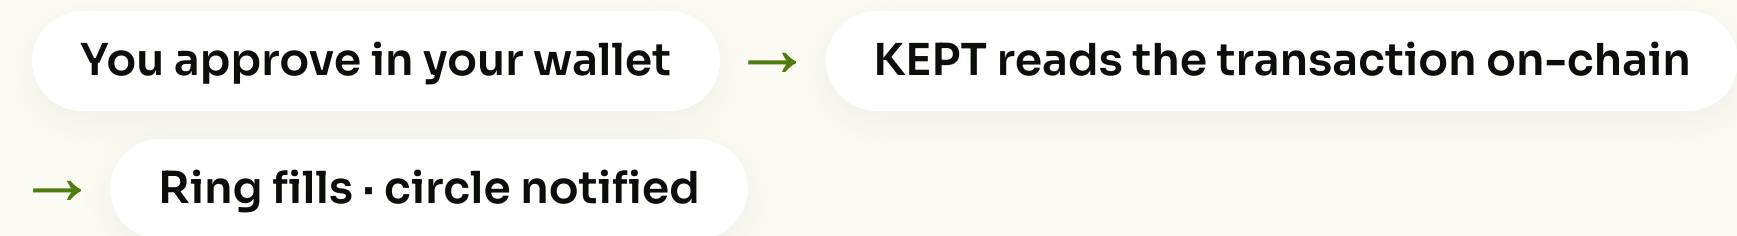

Buying is not available to U.S. persons or in restricted countries.

VERIFIED, NOT SELF-REPORTED

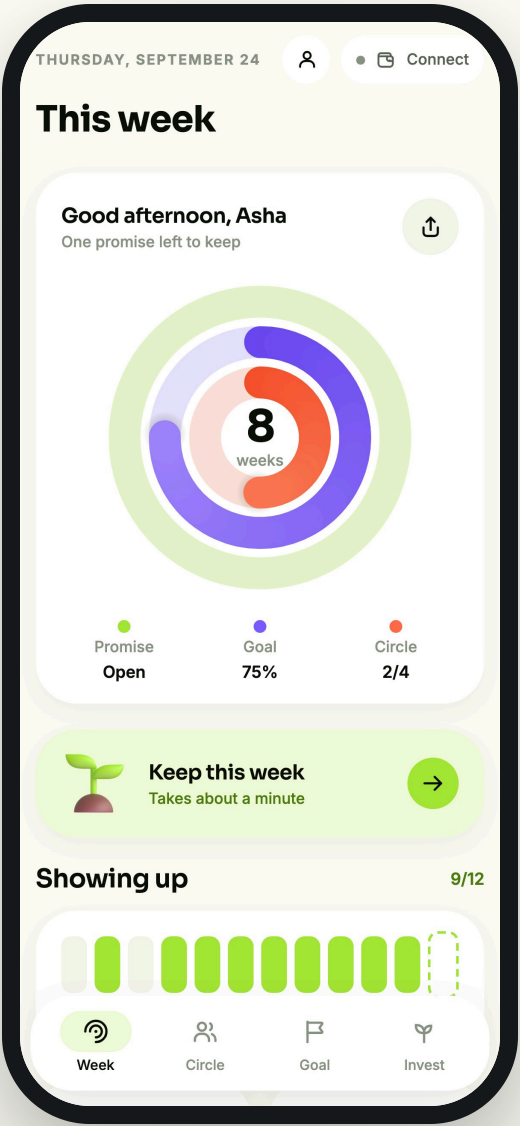

The streak is *real*.

A habit app with a checkbox is a to-do list. KEPT fills your ring only once the purchase is confirmed on Solana, from a wallet you've proven is yours.

THE MOMENT

The ring closes. The week is kept.

Before · promise open, 8 weeks

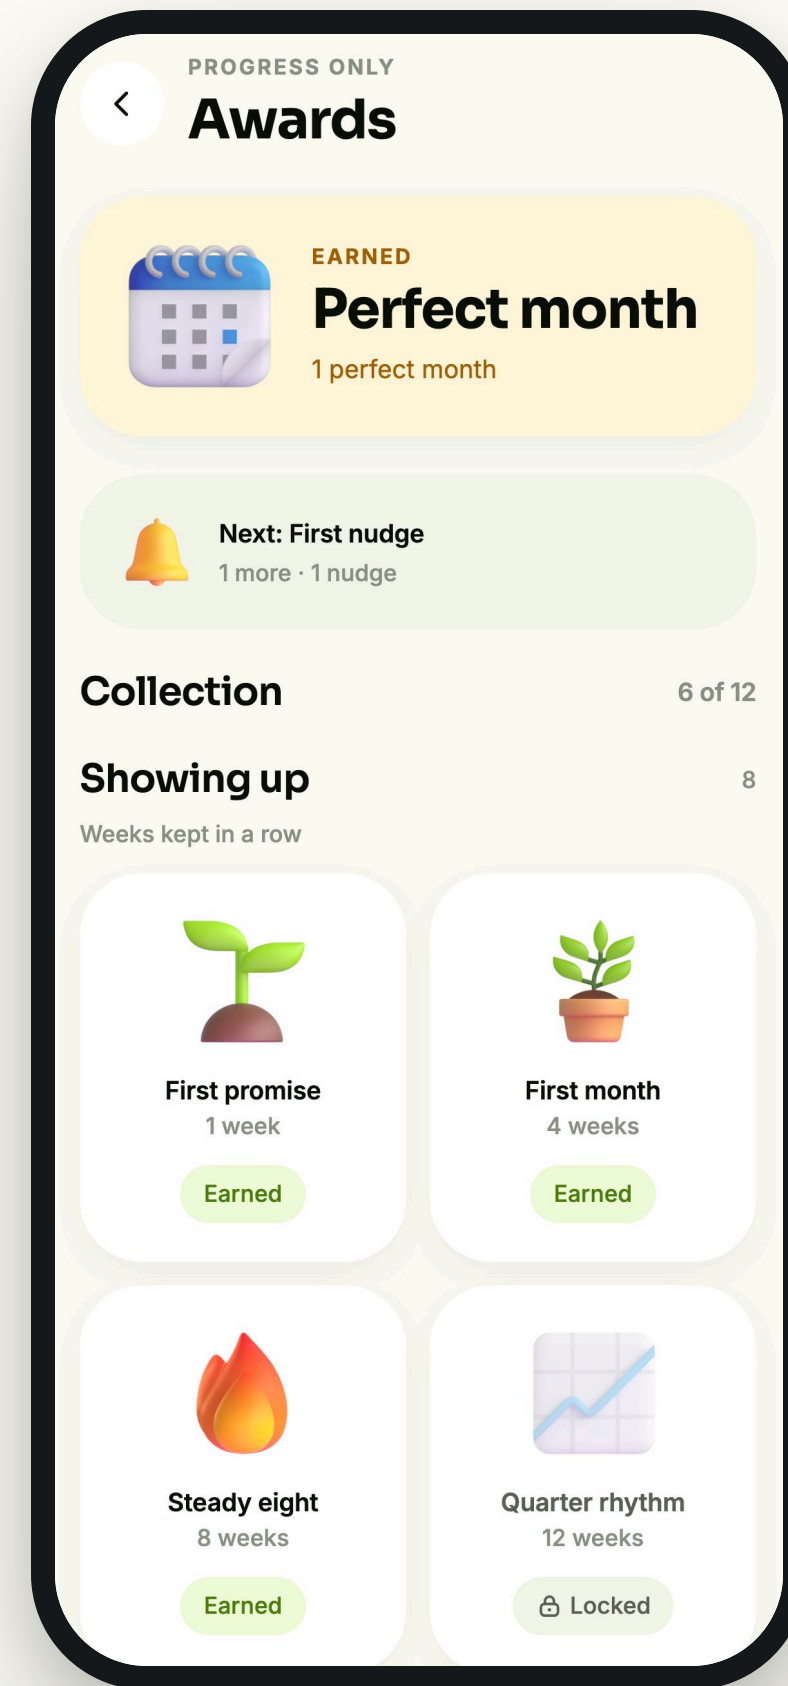

After · kept, 9 weeks, amount private

WHY PEOPLE COME BACK

Built for the six days in between.

- **A streak that forgives.** Perfect months alongside it, so a missed week never ends the story. No red, no guilt screens.
- **Twelve awards, none for being rich.** Half are earned through other people.
- **Nudges.** One per friend per week, only into an open week.
- **Cheers, not comments.** 🙌💜🔥🙌 — no advice, no pressure.
- **A home-screen widget** with your rings — progress, never money.

WHO IT'S FOR · WHERE IT IS

For people who've meant to start *for years.*

Who

- Anyone whose plan is “a bit, regularly, forever” — and keeps failing at regularly.
- Friend pairs, couples, siblings: two to five people who trust each other, but not with their balance.
- Solana Seeker owners, with the wallet already on the phone.

Today

- **Live on Solana mainnet** — real money, real assets.
- **Android beta 1.0.1**, from keptapp.pages.dev.
- **Production API** on Cloudflare, reading every purchase back from the chain.

BUILT ON SOLANA, FOR SOLANA MOBILE

Two things only the chain *does*.

Ownership without custody

Every holding sits in your own wallet. A group habit needs no group wallet — you can leave and lose nothing.

Proof, not a claim

“I invested this week” becomes something the app can check, which is what everything social rests on.

Two taps on a Seeker

Wallet already on the phone. Mobile Wallet Adapter with Seed Vault, Phantom or Solflare; your account follows your wallet.

Expo · Android · Cloudflare Workers, D1, Queues, Durable Objects · Jupiter · xStocks · Tessera · Solana mainnet

UNDER THE HOOD · ARCHITECTURE

The whole backend is one *Worker*.

ON THE PHONE

The KEPT app

Expo SDK 55, React Native 0.83. Rings drawn in Skia, data through TanStack Query.

Your wallet

Seed Vault, Phantom or Solflare, over Mobile Wallet Adapter. It signs; KEPT never holds a key.

Home-screen widget

Native Android, in Kotlin. Rings only — never money.

KEPT ON CLOUDFLARE

API · Hono on Workers

43 routes, every body checked by Zod. Sessions by Better Auth.

D1 · SQLite

19 tables, 11 migrations: goals, weekly promises, circles, orders, purchases.

Queues

Purchase checks, push and backfills, retried up to ten times with backoff.

Durable Objects

A live WebSocket room per circle. Exact rate-limit counters.

One cron, every five minutes

Re-checks stuck purchases. At 01:15 UTC it opens the week's promises and sends reminders.

SOLANA & PARTNERS

Jupiter

Swap orders and execution, live prices, charts.

xStocks

1,100+ tokenized stocks and ETFs. The catalogue is cached for an hour.

Tessera

Private markets, with an offline fallback so the lane never empties.

Solana RPC

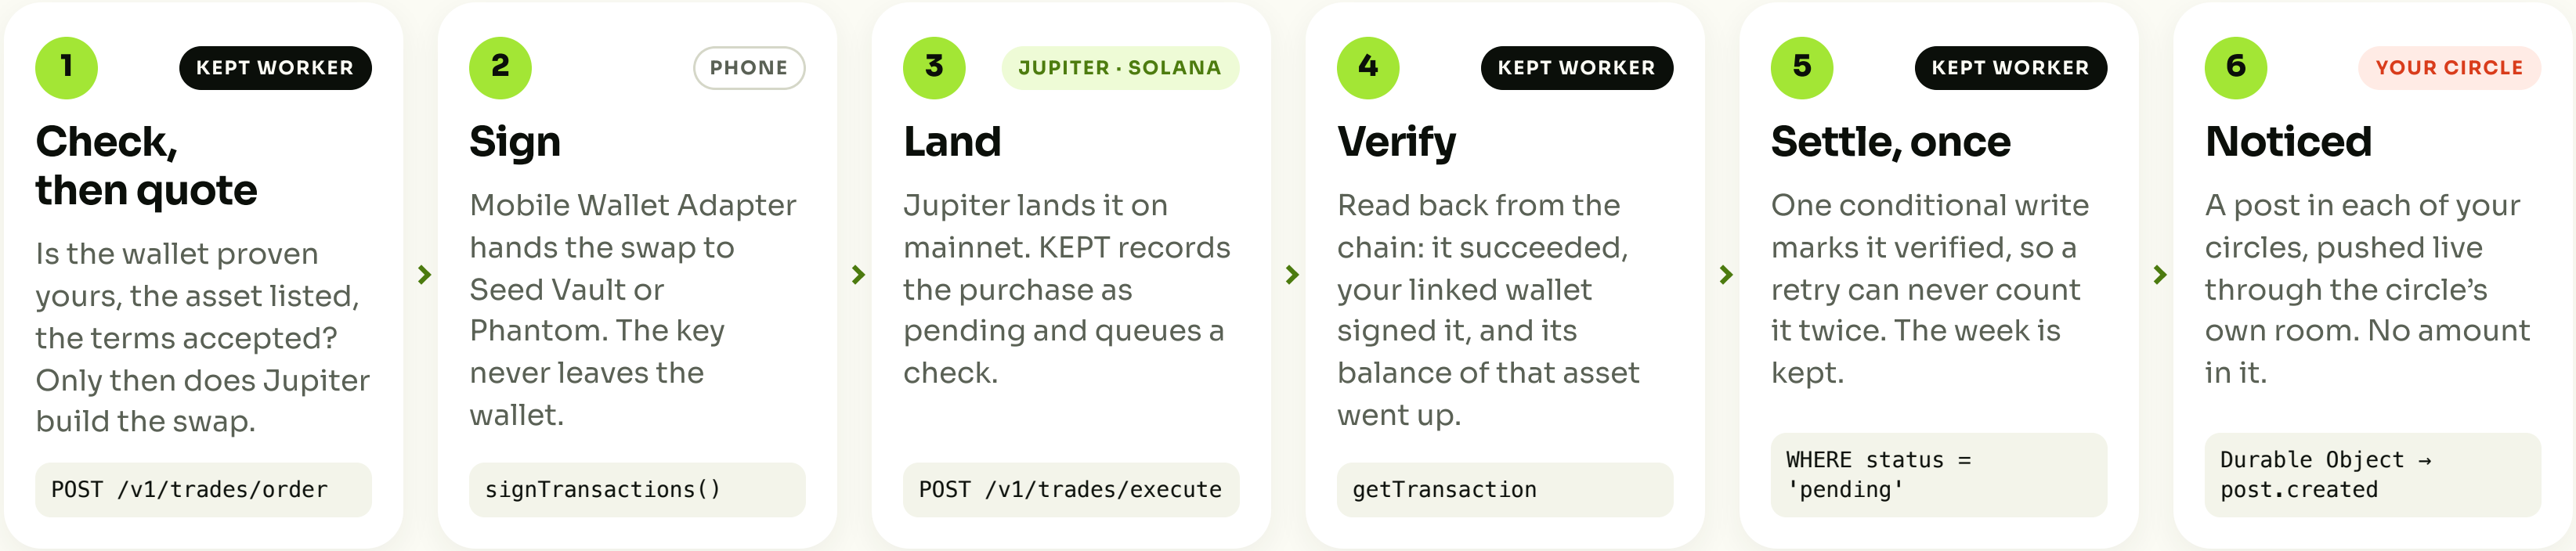

Mainnet, through a private endpoint. The source of truth.

Expo Push

Reminders and nudges, through FCM.

UNDER THE HOOD · ONE PURCHASE

From tap to *kept*.

If anything stalls

A failed check retries up to ten times, backing off.

Every five minutes, anything pending over two minutes is checked again.

Unseen after ten minutes, it is rejected. Nothing counted, nothing posted.

UNDER THE HOOD · PRIVACY

Private by *construction*.

- **No field to leak.** The circle queries never select an amount, an asset or a balance. Every route that returns money answers only to your own session.
- **Members only.** Every circle route checks membership first. A stranger gets a 403 on the circle, its feed and its live room, and a test proves it.
- **Invites nobody can guess.** 72-bit tokens, stored only as SHA-256 hashes, gone after 72 hours.
- **Live rooms by ticket.** HMAC-signed, bound to one circle, valid for 60 seconds.

What a friend's app receives about you · GET /v1/circles/:id

```
{
  "id": "...",
  "displayName": "Priya Raman",
  "avatarUrl": null,
  "privacyMode": "progress_only",
  "role": "member",
  "showedUp": true,
  "goalProgress": 0.62
}
```

What your circle's feed carries · GET /v1/circles/:id/feed

```
{
  "kind": "promise_kept",
  "body": "Kept this week's promise",
  "reactions": "👏:...🔥:..."
}
```

Your wallet is *your account*.

- 1 Start anonymous.** Open the app and you have an account. No email, no password. Sessions last a year, so a skipped week never signs you out.
- 2 Prove your wallet.** Sign one message that cannot move funds. Only a proven wallet can buy, and it belongs to one account.
- 3 Come back on any phone.** Sign again and your account, circles and streak are back. An empty account left behind is deleted.

WHAT YOUR WALLET IS ASKED TO SIGN

Use this wallet with KEPT.

Wallet: 7Xq3...mP4v

Challenge: challenge_3f9c...

Expires: 2026-09-24T18:05:00Z

This signature does not authorize a transaction.

Checked with ed25519 on the Worker · single use · expires in five minutes

UNDER THE HOOD · RELIABILITY AND SECURITY

Careful where money *moves*.

Counted exactly once

Settling is a conditional write. Two workers checking the same purchase cannot both post it.

The chain is the ledger

Holdings are the balance change read from the transaction, not the router's estimate.

Never stuck at pending

Retries, a five-minute sweep, and a hard stop: unseen after ten minutes means it never landed.

Limits that limit

A Durable Object per key counts exactly: 20 sign-ins a minute per address, 30 quotes per user. Cloudflare's own binding was tried first, and never said no.

Fails closed

Without a strong signing secret, every route but the health check answers 503.

Always a way out

Selling never waits on the terms. Unlink a wallet, leave a circle or delete the account, in the app.

36 API tests in the Workers runtime · CI on the app, the API and the site · 43 routes · 19 tables · 11 migrations · one cron

WHAT'S NEXT

From beta to *everyone*.

NOW

Launch

- **The Solana dApp Store** listing.
- **Push reminders on:** built and tested, switching on for the dApp Store release.
- **A real-money pass on a Seeker:** buy, verify, sell, reinstall.
- **A legal review** of the terms and the restricted countries.

NEXT

More worth keeping

- **More private markets:** Anthropic, Anduril, Neuralink and Polymarket through PreStocks, once their issuer controls are disclosed.
- **Share more, if you choose:** amounts or holdings, for a circle you trust completely. Already in the schema, off by default.
- **Cash out to a bank:** USDC to spendable money, through an off-ramp partner.

LATER

Wider

- **iOS.** The API is ready; connecting a wallet there is what's left to build.
- **Circle streaks:** weeks the whole circle keeps together. Still never an amount.
- **More countries,** as the issuers allow them.

Most investing apps ask what you're worth.

This one asks whether you *showed up*.
